

EST 2019 · BALLERS KINGDOM HOME INSPECTIONS

FREE HOMEOWNER'S INSPECTION GUIDE

A premium takeaway for clients — what we inspect,
what is not included, limitations, and next steps.

ballkingdom.com · Inland Empire, California

Free Homeowner's Inspection Guide

Why this guide exists

You just booked a home inspection. This leave-behind tells you exactly what we inspect, how we write it (Location -> Condition -> Implication -> Recommendation), and what happens after the report. No classroom filler — just the workflow buyers actually use.

How to use it

1. Read the scope table (p.3) before we arrive — know what is included. 2. Follow along on inspection day with the same checklist we use. 3. After the report, use p.10–11 to prioritize: Safety -> Structure -> Moisture -> Systems.

What we stand on — The Three F's

Faith — character shapes performance. Family — every athlete is someone's son or daughter first. Furtherment — you leave better than you arrived. We inspect homes the same way.

Tip: This is the client-facing summary. The full field workflow

Learn -> Study -> Practice -> Inspection -> Report lives at the Inspector OS (the-ballers-kingdom.web.app/operations) with CRM, Pipeline, and guided checklists.

What we inspect — and what we don't

System	Included	Not included / limitation
Roof	Cover, drainage, flashings, penetrations	Prediction of life, invasive testing
Exterior	Siding, trim, grading, vegetation	Boundary, soil testing
Attic / Roof Structure	Insulation, ventilation, framing (where visible)	Engineering analysis
Foundation / Crawl	Foundation, sills, moisture signs (visible)	Soil report, destructive probing
Electrical	Panels, wiring (visible), outlets, GFCI/AFCI	Load calc, low-voltage
Plumbing	Pipes (visible), fixtures, water heater, drains	Sewer scope unless added
HVAC	Heating/cooling operation, filters, ducts (visible)	Efficiency testing
Interiors	Walls, ceilings, floors, doors/windows, stairs	Cosmetic, code search
Kitchens / Baths / Laundry	Counters, cabinets, plumbing, exhaust	Appliance life prediction
Decks / Garages	Structure, attachment, rail/steps	Outbuilding scope unless booked
Environmental	Visible screening only (mold, radon flagged)	Lab testing unless added

Roof & Exterior

Location -> Condition -> Implication -> Recommendation

Example: "South roof slope, asphalt shingle — granular loss and lifted tabs at ridge — accelerates wear and raises leak risk — recommend qualified roofer to repair and reassess remaining life." Look for: missing tabs, ponding, failed flashing at valleys/chimneys, vegetation contact. Limitation: we do not predict remaining life or lift shingles invasively.

Field tip

Ask your inspector "where is that in the report?" — you should be able to trace every finding back to a photo and a checklist item.

Attic, Insulation & Ventilation

We check insulation depth/type, ventilation (soffit/ridge/gable), and visible framing. Thin or displaced insulation = energy/moisture risk; blocked soffits = heat buildup. Example write: "Attic north bay — R-19 fiberglass, compressed at eaves — reduces thermal performance — add baffles and top-up insulation." Safety note: we do not enter unsafe or sealed attic areas.

Field tip

Ask your inspector "where is that in the report?" — you should be able to trace every finding back to a photo and a checklist item.

Structure & Foundation

Visible foundation walls, sills, posts, and floor framing from crawl or basement hatch. Hairline cracks vs offset/displacement matter. Moisture staining = monitor. Example: "West foundation wall, interior — vertical crack 1/8", no displacement, dry at time of inspection — monitor for movement/moisture — recommend structural review if it widens." No soil engineering.

Field tip

Ask your inspector "where is that in the report?" — you should be able to trace every finding back to a photo and a checklist item.

Electrical & Plumbing

Panels/wiring visible without dismantling, outlet sampling, GFCI/AFCI where required, fixture operation. Look for: double-tapped breakers, missing GFCI at wet areas, corroded valves. Example: "Kitchen west wall — outlet within 6' of sink lacks GFCI protection — shock hazard — add GFCI protection by electrician." Water heater TPR, gas flex, and drain flow are checked; sewer scope is separate.

Field tip

Ask your inspector "where is that in the report?" — you should be able to trace every finding back to a photo and a checklist item.

HVAC, Interiors & Kitchens/Baths

We operate HVAC in its season, check filters, visible ducts, and thermostat response. Interiors: walls/ceilings/floors, doors/windows, stairs/rails. Kitchens/baths: cabinets, counters, plumbing, exhaust. Example: "Master bath — exhaust fan vents to attic, not exterior — traps moisture — reroute to exterior wall/roof." No efficiency or code-search.

Field tip

Ask your inspector "where is that in the report?" — you should be able to trace every finding back to a photo and a checklist item.

How we write — the field system

Every finding uses one sentence: Location -> Condition -> Implication -> Recommendation -> Limitation (if needed). We batch evidence in the field (photo -> voice note -> video) and tag by system so your report is consistent, defensible, and tied to the same checklist you can follow along with on inspection day.

Field tip

Ask your inspector “where is that in the report?” — you should be able to trace every finding back to a photo and a checklist item.

What we cannot do — and why it protects you

A home inspection is visual and non-invasive. We do not open walls, lift shingles, move storage, or perform engineering, environmental lab, sewer, or code-search work unless you book it. Weather, access, and occupancy can limit areas — any limitation is listed in your report so you know what was not seen.

Common exclusions

- * Inside walls / under flooring
- * Sewer line (unless scope added)
- * Radon / mold / asbestos lab testing (screen only)
- * Pest / wood-destroying organisms (separate)
- * Pools, irrigation, solar unless booked
- * Remaining-life / cost-to-cure predictions

Prioritize like an inspector

1) Safety first — GFCI/AFCI, TPR, rail/step, egress, combustion/air. 2) Structure & moisture — roof, foundation, grading, plumbing leaks. 3) Systems — HVAC, electrical capacity, water heater, drainage. 4) Comfort & efficiency last — insulation, windows, cosmetic.

Your 48-hour checklist

- * Review the report summary + tagged photos
- * Share it with your agent — negotiate with specific line items
- * Book follow-up specialists only where we recommended
- * Schedule maintenance: roof, HVAC filter, water heater, GFCI test
